

## Notations

- $X = (X_1, X_2, \dots, X_n)^T$  is a  $n$ -dim random vector of observed time series.
- $\mu = (\mu_1, \mu_2, \dots, \mu_n)^T \in \Re^n$  is the unobserved truth.
- $e = (e_1, e_2, \dots, e_n)^T$  is a  $n$ -dim random vector which represents the random error.

## Observations

We assume the observed time series is a sample from:

$$X = \mu + e. \quad (1)$$

## Errors

We assume the error  $e$  follows:

- $e_1, e_2, \dots, e_n$  are i.i.d. distributed. For convenience, we denote the distribution as  $\varepsilon$ .
- $E\varepsilon = 0$
- $E\varepsilon^k$  are existed and bounded for  $k = 2, 3, 4$

## Moments

Suppose  $E\varepsilon^k = M_k$ , we have

- $Ee^T e = nM_2$
- 

$$\begin{aligned} Ee e^T e &= E \begin{pmatrix} e_1 \\ e_2 \\ \vdots \\ e_n \end{pmatrix} \sum_{i=1}^n e_i^2 \\ &= M_3 1_n \end{aligned} \quad (2)$$

•

$$\begin{aligned}
 Ee^T ee^T e &= E\left(\sum_{i=1}^n e_i^2\right)^2 \\
 &= E\left(\sum_{i=1}^n e_i^4 + \sum_{i \neq j} e_i^2 e_j^2\right) \\
 &= nM_4 + n(n-1)M_2^2
 \end{aligned} \tag{3}$$
